Understanding project  
requirement and how  
to approach the  
problem

# Project Description

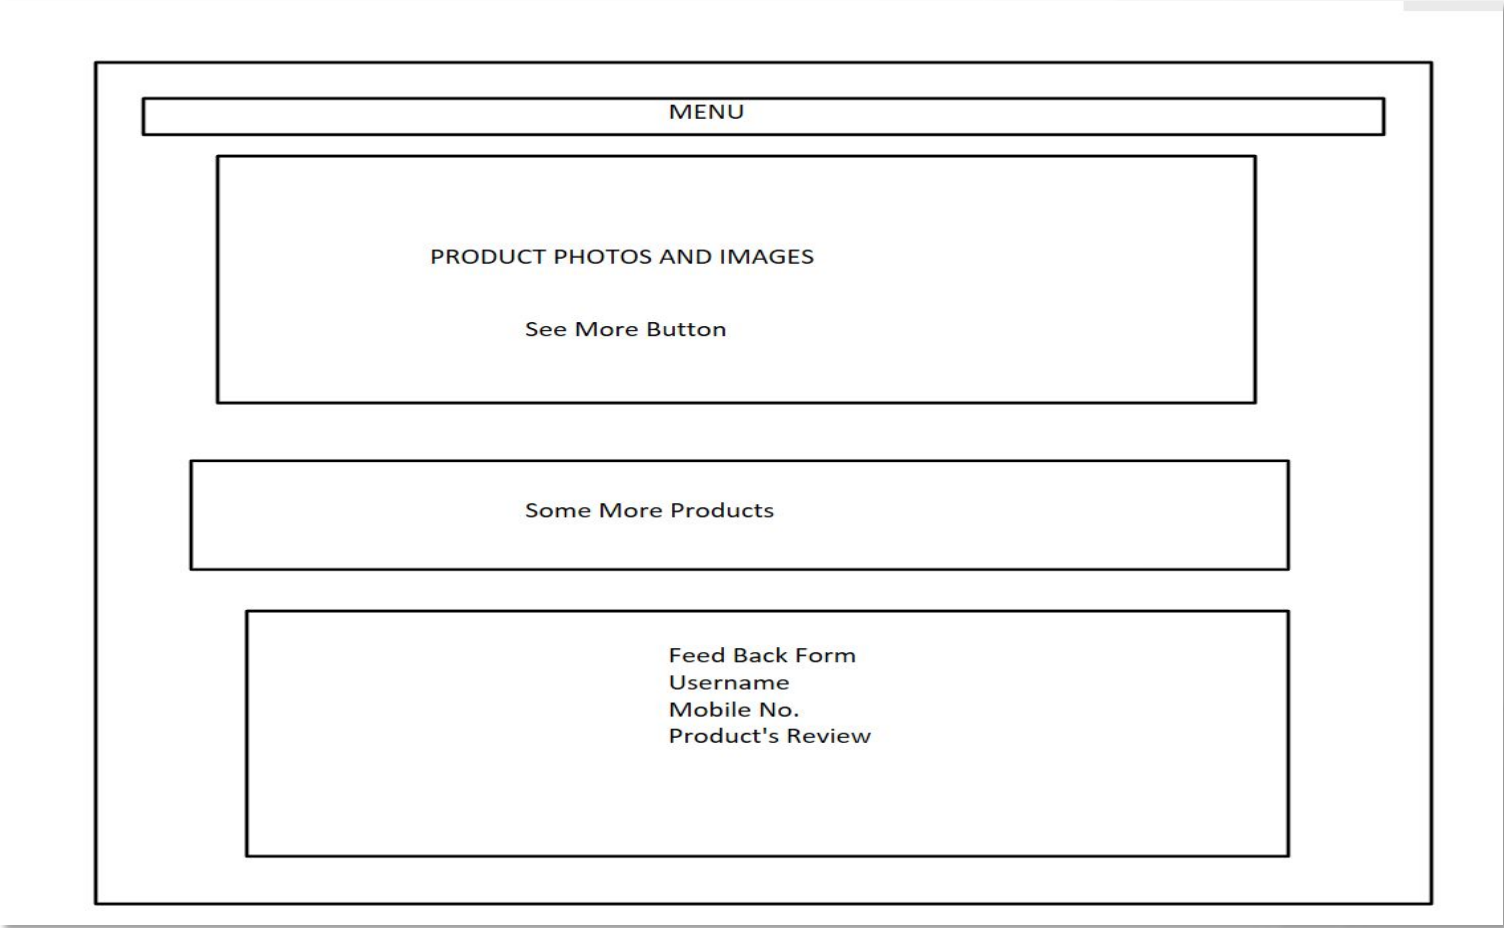

# Grocery Application

## Problem statement

- You have to develop a **single-page Grocery Application** that allows a user to **view different grocery products** that are available.
- The website will contain **information of the products**, including their images and description. Initially, only a few products will be displayed on the webpage and in order to view rest of the products, user will have to **click the view more** button.
- There should be a **feedback form at the end of the website**, which will take feedback from the user regarding the website design.
- The form data will be **posted to the backend by making an API call**. An API will be provided for this purpose.
